Buffalo Filter PlumePort® Laparoscopic Smoke Filtration Device Now Available in North America

Lancaster, New York – April 17, 2018 – Protecting healthcare workers and patients from the hazards of surgical smoke is easy with PlumePort®, a cost-effective solution for managing and filtering surgical smoke during laparoscopic surgery.

PlumePort easily connects to standard trocars to safely filter surgical smoke particulates, and aerosolized contents out of the peritoneum during laparoscopy. The adjustable flow control mechanism maintains peritoneal distention while the fluid management ensures minimal flow degradation in high moisture environments. Unlike competitive products, the moisture is controlled through a dual management process of a wicking agent and fluid trap, protecting essential media integrity. In addition, the ULPA filtration system features two times more filtration, providing enhanced protection and longer filter life which ensures there is no need to change filters during surgery due to flow degradation caused by moisture buildup. This not only saves time for the surgery team, but is also a much more cost-effective solution for the facility.

With the North American release of PlumePort, Buffalo Filter now offers the most comprehensive, clinically effective portfolio of active and passive laparoscopic smoke filtration devices.
